MODBUS COMMUNICATION PROTOCOL

## Public version

Version 1.11

# Index

# 1. Introduction

The RS485 serial interface supports the Modbus (RTU) protocol. In this document only the information necessary to read/write from/to EM500 has been reported (not all the parts of the protocol have been implemented).
For a complete description of the Modbus protocol, please refer to the latest revision of the "Modbus_Application_Protocol" document that is downloadable from the www.modbus.org web site.

# 2. Modbus functions

These functions are available on EM500 SERIES:

- Reading of n "Holding Registers" (code 03h),
- Reading of n "Input Register" (code 04h),
- Writing of one "Holding Registers" (code 06h),
- Writing of one "Holding Registers" (code 10h),
- Broadcast mode (writing instruction on address 00h).

***IMPORTANT***:

- In this document the "Modbus address" field is indicated in two modes:
    - "**Modicom address**": it is the "6-digit Modicom" representation with Modbus function code 04 (Read Input Registers). It is possible to read the same values with function code 03 (Read Holding Registers) replacing the first digit ("3") with the number "4".
    - "**Physical address**": it is the "word address" value to be included in the communication frame.
- The functions 03h and 04h have exactly the same effect and can be used indifferently.
- The communication parameters are to be set according to the configuration of the instrument.

## 2.1 Function 03h (Read Holding Registers)

This function is used to read the contents of a contiguous block of holding registers (word). The Request frame specifies the starting register address and the number of registers to be read. It is possible to read maximum 125 registers (words) [250 bytes] with a single request.
The register data in the response message are packed as two bytes per register (word), with the binary contents right justified within each byte. For each register, the first byte contains the high order bits (MSB) and the second contains the low order bits (LSB).

## 2.2 Function 04h (Read Input Registers)

This function code is used to read the contents of a contiguous block of input registers (word). The Request frame specifies the starting register address and the number of registers to be read. It is possible to read maximum 125 register (word) [250 bytes] with a single request.
The register data in the response message are packed as two bytes per register (word), with the binary contents right justified within each byte. For each register, the first byte contains the high order bits (MSB) and the second contains the low order bits (LSB).

## 2.3 Function 06h (Write Single Holding Register)

This function code is used to write a single holding register. The Request frame specifies the address of the register (word) to be written and its content.
The correct response is an echo of the request, returned after the register content has been written.

## 2.4 Function 10h (Write multiple registers)

This function code is used to write a block of contiguous registers (maximum 123 word [246 bytes]). The requested values to be written are specified in the request data field. Data is packed as two bytes per register. The correct response returns the function code, starting address, and the quantity of written registers.

## 2.5 Broadcast mode

In broadcast mode the master can send a request (command) to all the slaves. No response is returned to broadcast requests sent by the master. It is possible to send the broadcast message only with function code 06h and 10h using address 00h.

## 2.6 Application notes, *RS485 general considerations*

- To avoid errors due to the signal reflections or line coupling, it is necessary to terminate the bus at the beginning (master side, if not already embedded, by inserting a 120 ohm 1/2W 5% resistor between line B and A) and at the end (in EM500 interface by connecting the terminal B+ with the terminal T in the last instrument.
- The network termination is necessary even in case of point-to-point connection and/or of short distances.
- For connections longer than 1000m or if in the network there are more than 160 instruments (with 1/5 unit load as used in EM500 interface), a signal repeater is necessary.
- For bus connection it is suggested to use an AWG24 balanced pair cable and to add a third wire for GND connection. If a shielded cable is used, connect the shield to GND.
- The GND should be connected to ground only at the host side.
- If an instrument does not answer within the “max answering time”, it is necessary to repeat the query. If the instrument does not answer after 2 or 3 consecutive queries, it is to be considered as not connected, faulty or reached with a wrong address. The same consideration is valid in case of CRC errors or incomplete response frames.

## 2.7 Modbus timing

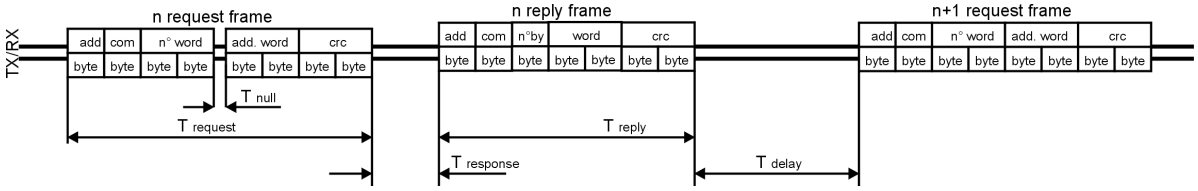

***Fig. 1** : 2-wire timing diagram*

**Table 2.13 - Timing of reading function**

| Timing characteristics of reading function: | ms |
|---|---|
| T response: Max answering time | 500 ms |
| T response: Typical answering time | 40 ms |
| T delay: Minimum time before a new query | 3.5 char |
| T null: Max interruption time during the request frame | 2.5 char |

# 3. Data Format, Variables and param

## 3.1 Data format representation In Carlo Gavazzi instruments

The variables are represented by integers or floating numbers, with 2's complement notation in case of "signed" format, using the following:

**Table 3.1 - Data format representation**

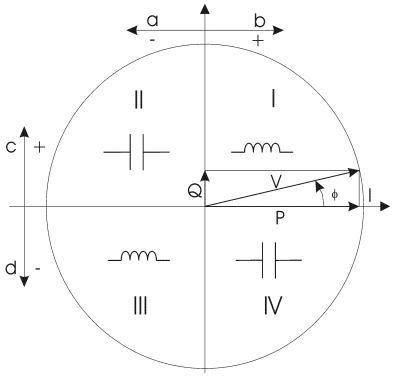
| Format | IEC data type | Description | Bits | Range |
|---|---|---|---|---|
| INT16 | INT | Integer | 16 | - 32768 .. 32767 |
| UINT16 | UINT | Unsigned integer | 16 | 0 .. 65535 |
| INT32 | DINT | Double integer | 32 | $-2^{31} .. 2^{31}$ |
| UINT32 | UDINT | Unsigned double integer | 32 | $0 .. 2^{32-1}$ |
| UINT64 | ULINT | Unsigned long integer | 64 | $0 .. 2^{64-1}$ |
| IEEE754 SP | - | Single-precision floating-point | 32 | $-(1 + [1 - 2^{-23}]) \times 2^{127} .. 2^{128}$ |

For all the formats the byte order (inside the single word) is MSB->LSB. In INT32, UINT32 and UINT64 formats, the word order is LSW-> MSW.

## 3.2 Geometric representation

According to the signs of the power factor, the active power P and the reactive power Q, it is possible to obtain a geometric representation of the power vector, as indicated in the drawing below, according to EN 60253-23:

**Table 3.2 - Geometric representation of variables**



a = Exported active power
b = Imported active power
c = Imported reactive power
d = Exported reactive power

According to the measurement mode, the following sign convention is used.

- P < or > 0 (with indication of "-" sign)
- kWh+ increasing only when P > 0
- kWh- increasing only when P < 0
- kvarh+ increasing only when Q > 0
- kvarh- increasing only when Q < 0
- PF with ±C or ±L indication

### 3.3 Maximum electrical values

If the input is above the maximum value, the display shows “EEE”.
The overflow indication “EEE” is displayed when the MSW value of the relevant variable is 7FFFh.

Protocol ID shall be used into Modbus map to distinguish the differences between models. If registers are available for every model the FW code shall be substituted with ALL.

***IMPORTANT***:

- Reading values in addresses not specified in the below tables returns an illegal data address exception;
- writing is not inhibited while user interface is inside a menu, so the last command takes place (display save or serial communication).

# 5. Revisions

| Revisions | Date | Note |
|---|---|---|
| Rev. 1.0 | 17/06/2020 | First release |
| Rev. 1.0 | 20/06/2020 | Added note to register 0x1103 |
| Rev. 1.0 | 23/06/2020 | Notes formatting |
| Rev. 1.1 | 09/09/2020 | Changed phase sequence values |
| Rev. 1.2 | 23/11/2020 | Corrected Modicom addresses and document formatting |
| Rev. 1.3 | 01/01/2021 | Changed the default value for the parameter Screen Saver time (1602h) from “0” to “5” |
| Rev. 1.4 | 15/06/2021 | Corrected backlight time values (15 minutes instead of 20) |
| Rev. 1.5 | 20/10/2021 | Add. 0x2200 Module external revision |
| Rev. 1.6 | 21/12/2021 | Add. 1106h / 1107h sine & cosine for calculate zones wrong connection 4.6.8 |
| Rev. 1.7 | 13/01/2023 | Modified / insert Gavazzi Code for bidirectional |
| Rev. 1.8 | 04/10/2024 | Added model EM530DINMV53XS1X;<br>Pag 20, par. 4.2.12 , tab. 4.15 : Correction of modicom addresses |
| Rev. 1.9 | 30/10/2024 | Correction of some Modicom addresses.<br>Added further information about EM530DINMV53XS1X. |
| Rev. 1.10 | 04/04/2025 | P. 18, par. 4.2.5, tab. 4.8, correction of the minimum value for the parameter “Primary current value” for the MV5 model: replaced the wrong value “10” with correct value “100”. |
| Rev. 1.11 | 07/08/2025 | P. 18, par. 4.2.5, tab. 4.8, added current range for EM530DINRG53XS1X model. |
