#### Electrodes and electrode holders

Use electrodes or electrode holders type: SN1/PS31/PS3S/SCM/CGL or similar. See page 19-5.

#### FUNCTIONS

A- Emptying with MIN and/or MAX alarms.

B- Filling with MIN and/or MAX alarms.

#### EXAMPLE OF EMPTYNG OPERATION

To achieve this type of operation, two electrodes are used to control the liquid between the fixed limits using MIN1 and MAX1 and two alarm levels using MIN2 and MAX2. When one of the alarm electrodes is wet, the alarm relay is de-energised.

The alarm can be caused by pump malfunction, insufficient pump delivery capacity, MAX control level failure or MIN level electrode shorted.

With a proper connection, only the MIN alarm or MAX alarm can be activated or neither of the two can be activated so the relative output contacts can be used for pump control.

C- Emptying with pump priority change.

D- Filling with pump priority change.

#### EXAMPLE OF EMPTYNG OPERATION

This operation is obtained by using four electrodes positioned at four different levels and two relay outputs to control two pumps.

For example, one can place the four electrodes, MIN1, MIN2, MAX1 and MAX2, in increasing order from the lowest to the highest levels and must control the tank emptying. Usually, the level is controlled between the MIN1 and MAX1 levels by starting one of the two pumps but this case is different so the pumps can be maintained at the best efficiency and optimise their wear.

When the liquid wets the MAX2 level and because the first pump is faulty or else a higher delivery capacity is needed, the second stand-by pump is activated to back up the first pump. When the liquid lowers and no longer wets the MIN2 level, the second pump is stopped and then when the MIN1 level is no longer wet, the first pump is stopped too.

E- Tank filling and well drawing with alarm.

#### EXAMPLE OF OPERATION

Two electrodes are used in this operation to control the tank level and another two for the well. One relay is used to activate the pump while the other for dry running / no water alarm.

When the well liquid wets the MAX2 level and the liquid wets the MIN1 tank level, the tank-filling pump is activated. When the tank MAX1 level is wet, the pump is stopped.

During the tank filling, the pump could stop before the MAX1 level is wet because the well MIN2 level is no longer wet.

Should the tank MIN1 level no longer be wet at which the pump should restart but the well MIN2 level is also no longer wet, then the alarm relay is de-energised.
